

5.2. To Sew Zippers

The zipper consists of a piece that can be moved by grasping these teeth with two lanes on which the teeth are arranged. When the mechanism is pulled, it joins the two strips together and ensures that the teeth on them are clamped, separating them when pulled in the opposite direction. This arrangement is used to connect the open ends of the pillow and cushion.

It has an important place in today's upholstery in terms of removing and washing the product. Usually applied on cushions and pillows.

Zipper types;

- Metal zippers
- Bone mechanism zippers
- Nylon Mechanism Zippers
- Distinctive zippers

When sewing zippers, ensure that the sewing range is frequent. Since the zipper switch will be difficult to install afterwards, the key is inserted before starting the process.
