

### 1.2.3 Cleaning

After that is made tetralogy of wooden structure, it is needed to prepare for process of upper surface of structure. After the end of the pressing of the wooden structure, it should be cleaned surplus of glue on combination points by wet rag or plate. It's prepared for upper surface while it is made polish grind and satin finish for wooden structure.

It's practised in relief if there is a smashed point in anywhere on the surface during the cleaning. It's just reviewed in this time because of making polish grind before matrixing. If there are some uncompleted parts that is made polish grind. It's cared that the surface doesn't scratch on grind. Final step is satin finish. It's made for removing the grind signs and roughness of the wooden surface. Thus the structure is made ready for upper surface process.
